## WHO SHOULD BE TESTED?

You should be tested for HIV  
when your behaviors put you at risk for infection.

The following behaviors put a person at high risk for HIV infection:

- ◆ Having unprotected sex (oral, vaginal, and anal) which involves contact with blood, semen, and/or vaginal fluids.
- ◆ Sharing needles and works for injecting drugs, vitamins, and/or steroids in which blood may be left in the needle or syringe.
- ◆ Coming in contact with another person's blood. Very rarely, this could happen from a blood transfusion or organ transplant. All blood products are currently screened for HIV.

## SYPHILIS TESTING

Free syphilis testing is available for clients who test confidentially for HIV. Syphilis testing requires a simple blood draw and results will be available two weeks after your visit. During your visit, you will be instructed on how to get your syphilis test results.

Please refer to the Clinic Locations section on the next page for the dates and times in which the syphilis testing is being offered. Unless otherwise noted, syphilis testing is available at all clinic locations.
